

## 1. Class to Object Diagrams

- a. Draw an Object Diagram for this Class Diagram that instantiates every Class exactly twice:

- b. Draw an Object Diagram for this Class Diagram that instantiates every concrete Class exactly once:

## 2. Scenario to Class Diagram (Abbott)

Consider you have to build a video management software which shows thumbnails and detailed information about each video file in a list.

USE CASE: Directory Import

FLOW OF EVENTS:

1. The user clicks the import button.
2. The system shows a file dialog.
3. The user selects a directory to import.
4. The system adds a new thumbnail for each imported file to the thumbnail panel.

Apply Abbott's textual analysis to extract a class diagram from the use case.

Explain the steps you have applied.

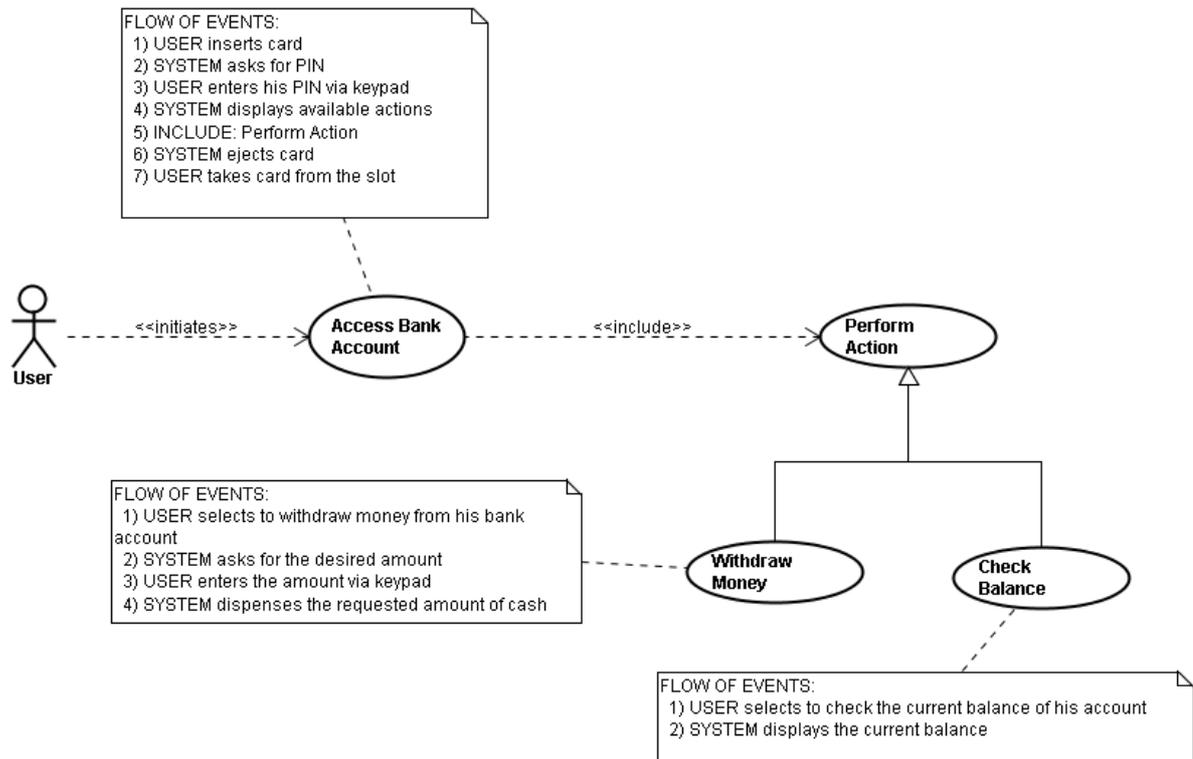

### 3. Scenarios to Use Cases

You are in the middle of transforming a set of scenarios for an Automatic Telling Machine into a Use Case Model.

Integrate the following scenario into the Use Case Diagram below.

#### FLOW OF EVENTS:

- 1) USER inserts card
- 2) SYSTEM asks for PIN
- 3) USER enters his PIN via keypad
- 6) SYSTEM displays available actions
- 7) USER selects to charge his card with e-money
- 8) SYSTEM asks for the desired amount
- 9) USER enters the amount via keypad
- 10) SYSTEM ejects card
- 11) USER walks away without taking his card back
- 12) SYSTEM beeps after 5 seconds
- 13) USER comes back
- 14) USER takes card from the slot

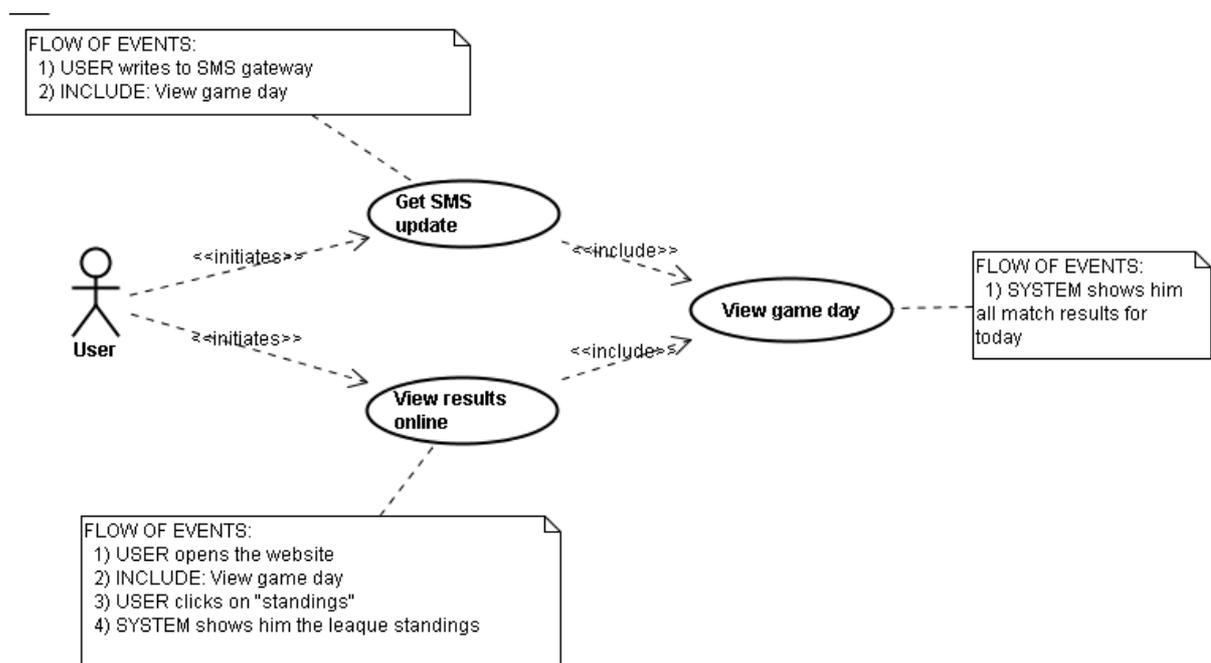

You have to draw a new diagram incorporating the changes, including all the flows of events that changed. (You can leave out comment boxes that are still exactly the same).

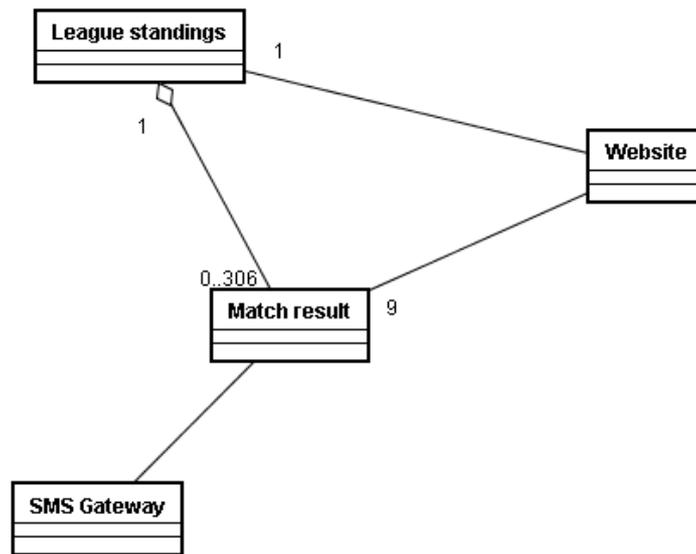

#### 4. Combine Domain Object Model and Use Cases to Analysis Object Model

The Bundesliga Live service offers up to date match results both through Website and SMS Gateway.

A use case model was created:

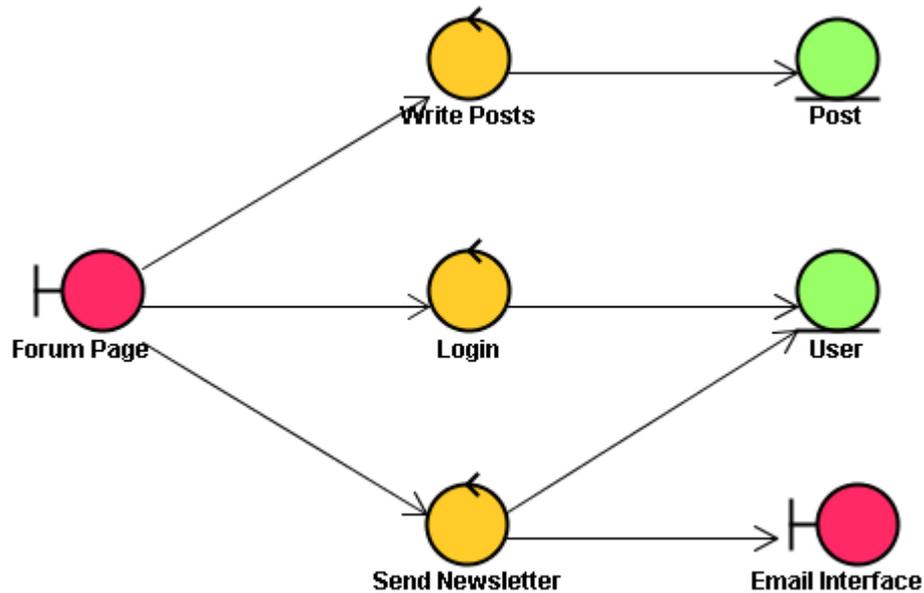

Also, domain objects are already identified:

Identify Boundaries, Controls and Entities in the Domain Object and Use Case Model and draw an Analysis Object Diagram with them.

## 5. Sequence diagram for a scenario

The following Analysis Object Diagram models a part of a simple forum software:

Consider the following scenario:

The admin of the forum wants to organize a user meeting. For this, he wants to write an invitation to every user and create a new post for the details.

### FLOW OF EVENTS:

- 1) ADMIN opens the forum page.
- 2) ADMIN enters his username and password.
- 3) SYSTEM validates the password.
- 4) SYSTEM shows he is now logged in.
- 5) ADMIN writes a newsletter.
- 6) SYSTEM gets all users' email addresses.
- 7) SYSTEM sends the newsletter to all users via the email interface.
- 8) ADMIN writes a new post.
- 9) SYSTEM saves the post.
- 10) SYSTEM confirms the successful save.

Complete the following Sequence Diagram to show the interactions involved in this flow of events. Remember to think about synchronous vs. asynchronous calls.

: Admin 

: Forum Page 

: Login 

: Send Newsletter 

: User 

: Email Interface 

: Write Posts 

: Post
